

Comfort and temperature

In this fictional teaching dataset, the shaded sessions have a mean comfort score of 5.8 out of seven. The unshaded sessions have a mean comfort score of 4.1 out of seven. The mean comfort difference is 1.7 points. Mean air temperature is 28.2 degrees Celsius in shade and 31.4 degrees Celsius without shade.

Attendance and interpretation

Twenty-two participants complete both sessions. Two participants miss their second session because of scheduling conflicts. The analysis includes only the 22 complete pairs. These descriptive results suggest better comfort in shade but do not establish improved learning. No statistical significance test or confidence interval is reported.

Recommendations

The findings note recommends a larger follow-up study across three campuses. Future work should measure noise, humidity, and seating quality. The team recommends testing morning sessions as well as afternoon sessions. It does not recommend a particular tree species or construction contractor.
